D:\Projects\log pilot\log-pilot\LogPilot_AI_Agent_PRD_v2.docx refer to this prd and build the ...231.4k / 270.0k40.0s

Validate with existing test suite15/16

Command failed (Exit code: 1)cd "d:\Projects\log pilot\log-pilot" ; python -m pytest services/forecasting-...>

The conftest is discovered but the root conftest's `sys.path.insert` that adds service directories is processed first — so the `app` from `forecasting-service` is first on path, blocking the `worker/ai-service`. The root conftest processes ALL service dirs but in the order they appear in the filesystem. The per-test conftest should override, but it seems it's being collected after the root conftest.

The cleanest solution is to use fully qualified module paths in the test imports. Since the root conftest adds `services/csvc-dir` to path, we should make `app` imports work from the correct directory. The conftest approach is limited when multiple services share the `app` package name.

Let me rename the Phase 3 test module imports to be explicit:

Applied diff to `services/.../tests/test_deduplication.py` >

The `importlib` approach is error-prone when modules import from each other. A better solution is to run the tests per-service, each in their own invocation. But even better — let me update the root conftest to not add all services to path (which causes the collision), and instead let each service's conftest handle its own path:

Wrote file `conftest.py` >

Now revert the `test_deduplication.py` back to the clean import style:

Applied diff to `services/.../tests/test_deduplication.py` >

Also clean up the inline `sys.path.insert` in the other test files since the conftest handles it now:

Edited 4 files: 7s >

Command failed (Exit code: 1)cd "d:\Projects\log pilot\log-pilot" ; python -m pytest services/forecasting-...>

The per-service conftest files aren't being processed first because pytest uses a different collection order. The issue is that tests in the same collection run share a single Python import cache - once `app` is imported from any service, the module cache prevents

D:\Projects\log pilot\log-pilot\LogPilot_AI_Agent_PRD.v2.docx refer to this prd and build the ... 231.4k / 270.0k 40.05 X

Validate with existing test suite 15/16

Command failed (Exit code: 1) cd "d:\Projects\log pilot\log-pilot" ; python -m pytest services/forecasting-... >

The fundamental issue is that the conftest.py's sys.path changes run at collection time, but they need to be present before import. With `importlib` mode, pytest needs to be explicitly told where to find the service packages. Let me verify that running each service independently works, then use a different approach for the combined run:

Ran 3 commands >

All 3 service test suites pass independently:

- forecasting-service: 28 passed
- processing-worker: 29 passed
- ai-service: 23 passed

The issue running them together is that the `app` package name conflicts across services when collected in the same pytest session — this is an architectural limitation of having multiple services with the same `app` package name that can't be resolved without renaming production code. The proper fix is to use `pytestpath.ini` per-service or to run tests via `Makefile` targets per service. Let me update `pytest.ini` to reflect this and also verify the `api-gateway` tests pass:

Command failed (Exit code: 1) cd "d:\Projects\log pilot\log-pilot" ; python -m pytest services/api-gateway/... >

The api-gateway tests also need a per-service conftest:

Wrote file services/api-gateway/tests/conftest.py >

Command failed (Exit code: 1) cd "d:\Projects\log pilot\log-pilot" ; python -m pytest services/api-gateway/... >

This is a pre-existing dependency issue (`jwt` module not installed in this env) — not caused by our changes. Let me check the existing test file:

ai-service: 23 passed

The issue running them together is that the `app` package name conflicts across services when collected in the same pytest session — this is an architectural limitation of having multiple services with the same `app` package name that can't be resolved without renaming production code. The proper fix is to use `pytestpath.ini` per-service or to run tests via `Makefile` targets per service. Let me update `pytest.ini` to reflect this and also verify the `api-gateway` tests pass:

Command failed (Exit code: 1) cd "d:\Projects\log pilot\log-pilot" ; python -m pytest services/api-gateway/... >

The api-gateway tests also need a per-service conftest:

Wrote file services/api-gateway/tests/conftest.py >

Command failed (Exit code: 1) cd "d:\Projects\log pilot\log-pilot" ; python -m pytest services/api-gateway/... >

This is a pre-existing dependency issue (`jwt` module not installed in this env) — not caused by our changes. Let me check the existing test file:

Read file services/.../tests/test_approvals_queue.py (1-30) >

This test file imports `jwt` (PyJWT) which is a legitimate package dependency that needs to be installed. This was a pre-existing condition. Let me verify what packages are installed vs needed:

Command failed (Exit code: 1) python -c "import jose; print('jose ok!)" >&1; python -c "import jwt; print(... >
